### 👤 PROFILE

Hello I am Gorkem who loves working with computers especially in web development mainly in the frontend area since it's where users are directly experiencing the product so it gives me the most satisfaction among the web development steps. I consider myself as a self-taught experienced frontend developer who is passionate about working with JavaScript, HTML and CSS to deliver exceptional and stunning customer experiences. Skilled in designing, developing and testing web-based applications incorporating the latest developments and trends. I am a collaborative team player who has strong sense of humor and positive relationships.

### 🏢 PROFESSIONAL EXPERIENCE

#### Aselsan Inc

Embedded Software Engineer

02/2018 – 07/2021 | Ankara, Turkey

Baremetal C and C++ application development on ARM cores for real-time applications and Video Streaming and UI Development in ARM Linux Environment

#### Storyly

Frontend Developer

07/2021 – 09/2022 | Ankara, Turkey

Storyly is an in-app engagement tool which brings stories into customers' both IOS, Android apps and web sites. My responsibilities at Storyly are developing and maintaining new features on dashboard where customer create their stories with their content and add all the interactive components that modern story apps have such as Instagram, Snapchat etc. My tech stack at Storyly is using React.js for javascript development part, using scss for styling and ant design for ready to use components with some customization, Redux-thunk for global state sharing across components.

#### JotForm

Senior Frontend Developer

09/2022 – present | Ankara, Turkey

Jotform is an all-in-one no-code platform that allows users go from busywork to less work with powerful forms that use conditional logic, accept payments, generate reports, and automate workflows. I am one of the members of enterprise product team and as a frontend developer my job is developing and maintaining features aiming for enterprise customers and customize their white-labeled domains according to their requests. My current tech stack is using React.js along with TypeScript for the logical development of my task and using vanilla CSS, SCSS, Tailwindcss for the style part. For state management, Context API and Redux are commonly used and when there is a need for keeping server and client states synced with each other, auto-refetching mechanisms with caching such as react-query is used.
